FOR IMMEDIATE RELEASE

Icomera Launches Next Generation Connectivity Platform for the Rail Industry

New revolutionary platform designed to drive the proliferation of onboard applications

Berlin, Germany, September 21st 2010 – Icomera, the world's leading provider of cellular broadband gateways for mobile applications, today announces its new Icomera X6 mobile access and application router. The announcement is made on the opening day of InnoTrans 2010 where the European rail industry converges every second year.

"We are very excited to be able to present this product," says Roger Sandén, President and CEO of Icomera. "Icomera created this market segment eight years ago and now we are raising the bar again. Although the Icomera X6 is only now being officially released we already have pre-orders from train operators and rolling stock manufacturers from around the world. The product has been extremely well received and we are now ramping up our production to meet the high demand."

For the first time the Icomera X6 offers the rail industry a standardised rail IP communications platform with broadband performance that is specifically designed to host third party applications. Icomera believes this will accelerate on-train application deployment by removing the technical and commercial barriers to collaboration and innovation between suppliers.

"Icomera X6 represents an entirely new generation of products that builds upon our almost decade long experience in this business," says Martin Bergek, Vice President, Business and Product Development. "It is a great combination of rail-grade state of the art hardware together with our new improved software platform," continues Martin Bergek.

Icomera X6 is available for order now. For more information, go to www.icomera.com. Or, if you are at the InnoTrans fair, please pay us a visit at 5.1/123.

About Icomera

Established in 1999, Icomera is the world's leading provider of cellular broadband gateways delivering Internet connectivity for passenger transport, public safety and enterprise applications. Icomera technology bridges wide-area 3G and 4G cellular networks with on-board Wi-Fi and Ethernet access. Icomera's award-winning devices are deployed on rail, road and sea in over 22 countries providing real-time high-speed access for passenger Wi-Fi, fleet tracking and control of mission critical on-board systems. Icomera is headquartered in Sweden with office in the United Kingdom, and channel partners worldwide. For more information visit <http://www.icomera.com>.
